Int 21H, AH=28H

Version

1 and higher

Brief

RANDOM BLOCK WRITE TO FCB FILE

Family API

Input

```
AH = 28h
CX = number of records to write
DS:DX -> opened FCB (see #01345)
Disk Transfer Area contains records to be written
```

Return

AL = status

```
    00h successful
    01h disk full or file read-only
    02h segment wrap in DTA
CX = number of records written
```

Notes

write begins at current file position as specified in FCB; the file position is updated after writing

if CX = 0000h on entry, no data is written; instead the file size is adjusted to be the same as the file position specified by the random record and record size fields of the FCB

if the data to be written is less than a disk sector, it is copied into a DOS disk buffer, to be written out to disk at a later time

not supported by MS Windows 3.0 DOSX.EXE DOS extender
