

This is part of **Win16 API** which allow to create versions of program from one source code to run under OS/2 and Win16. Under OS/2 program can be running under Win-OS/2 if program is Windows NE executable, and with help on Windows Libraries for OS/2, if it is OS/2 NE executable. [Here](#) is a WLO to OS/2 API mapping draft

LocalSize

Brief

Returns the current size (in bytes) of a local memory object.

Syntax

```
UINT WINAPI LocalSize(  
HLOCAL hMem  
);
```

Parameters

hMem - Handle to the memory object.

Return Value

Returns the size of the block, or zero if the handle is invalid or the object has been discarded.

Call GetLastError for extended error information.

Notes

The returned size may be larger than the originally requested size because of internal alignment.

Use LocalFlags first to check whether the block has been discarded.

Example Code

C Binding

```
UINT size = LocalSize(hMem);
```

MASM Binding

`push` hMem
`call` LocalSize
